# Convolutional Neural Network (CS.231)

32x32x3 image -> preserve spatial structure

32x32x3 image

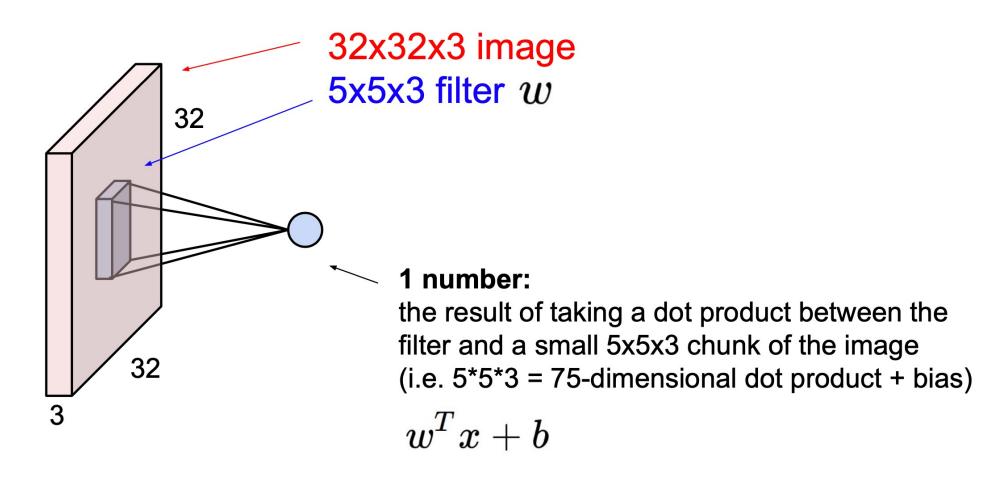

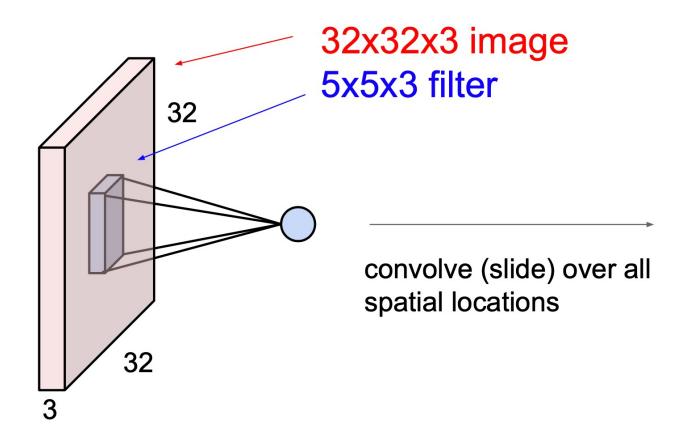

Filters always extend the full depth of the input volume

5x5x3 filter

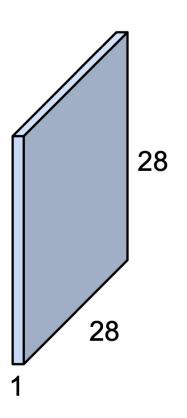

**Convolve** the filter with the image i.e. "slide over the image spatially, computing dot products"

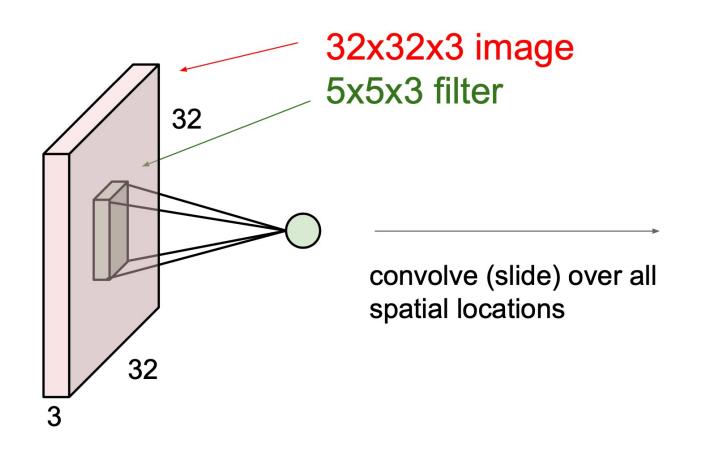

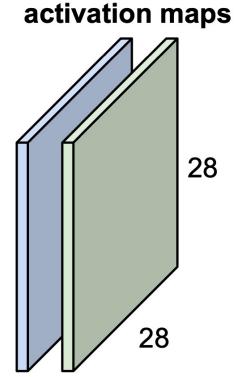

#### activation map

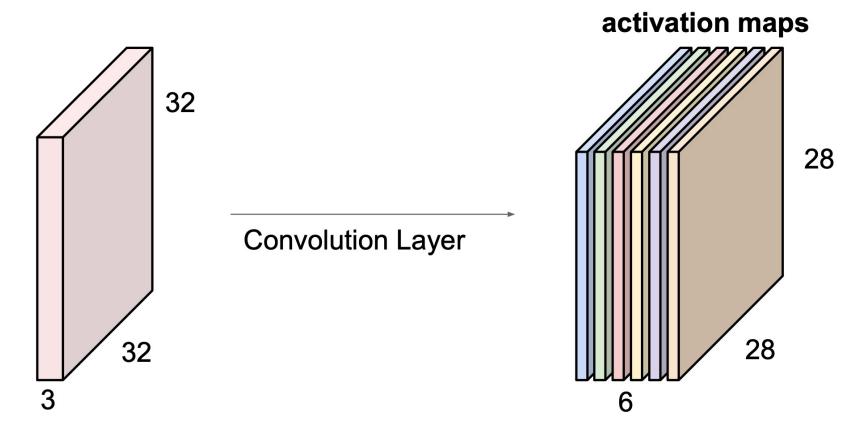

#### consider a second, green filter

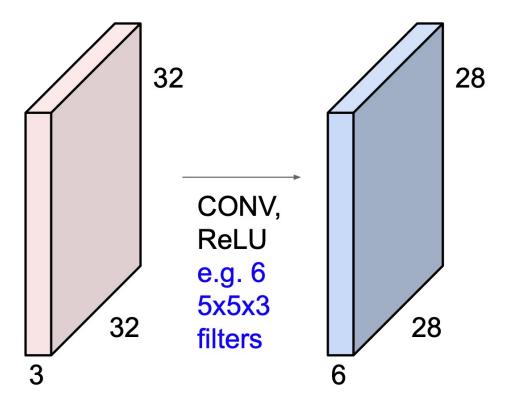

For example, if we had 6 5x5 filters, we'll get 6 separate activation maps:

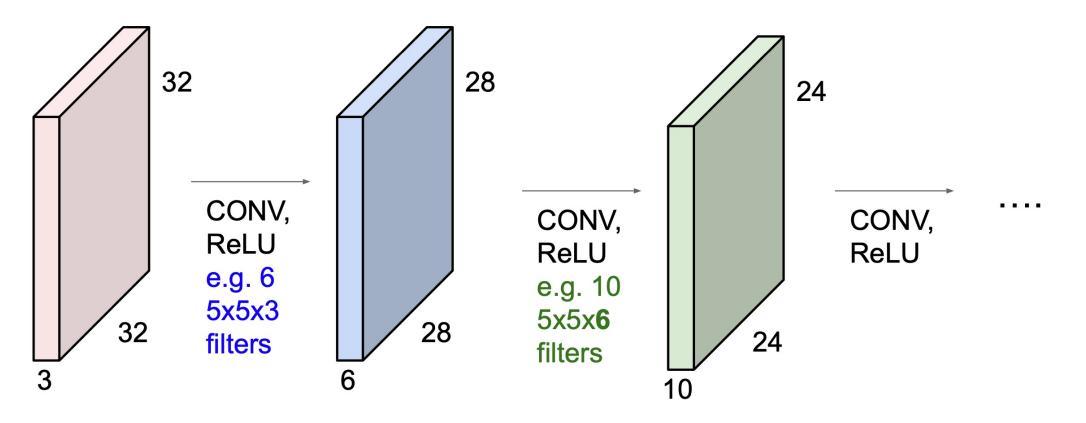

We stack these up to get a "new image" of size 28x28x6!

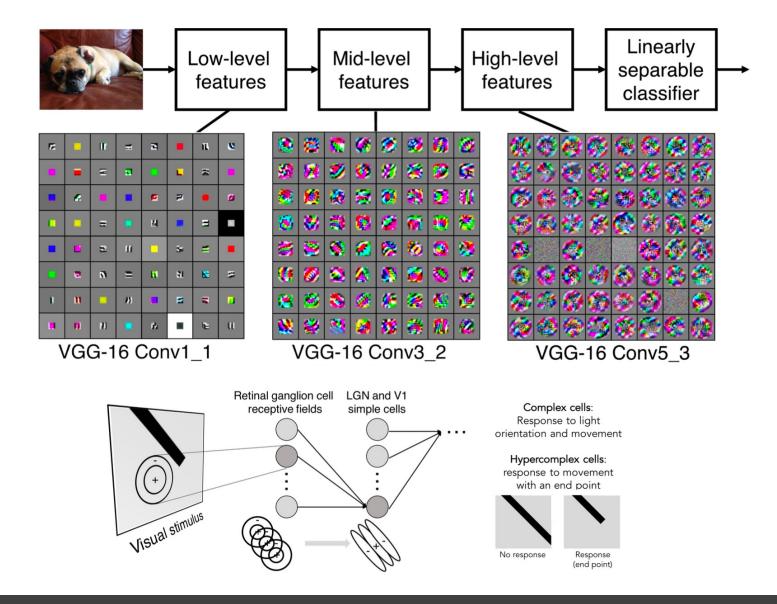

**Preview:** ConvNet is a sequence of Convolution Layers, interspersed with activation functions

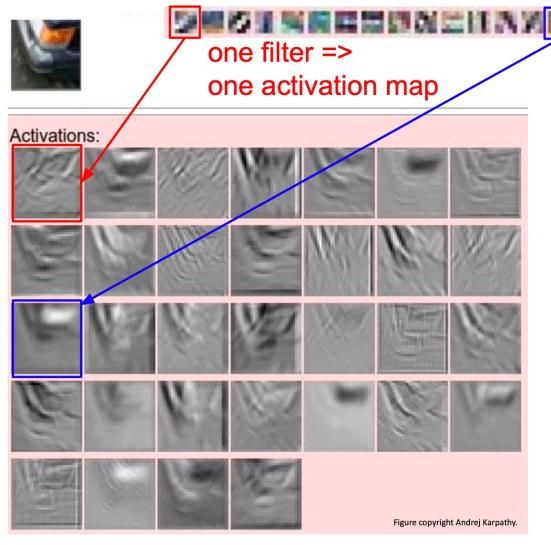

**Preview:** ConvNet is a sequence of Convolution Layers, interspersed with activation functions

#### **Preview**

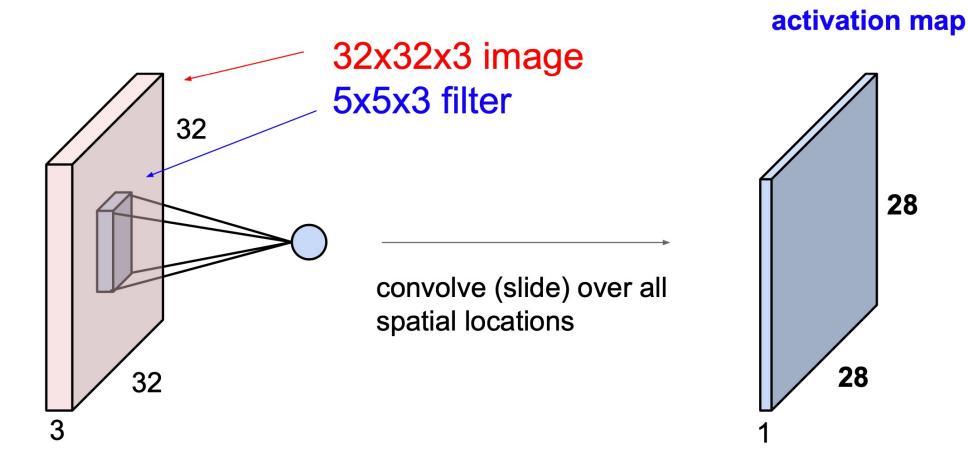

example 5x5 filters (32 total)

We call the layer convolutional because it is related to convolution of two signals:

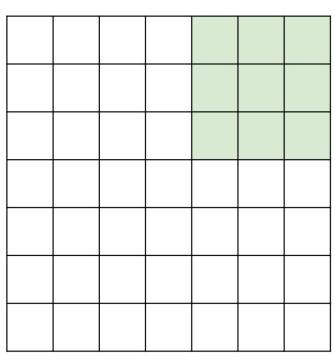

$$f[x,y] * g[x,y] = \sum_{n_1 = -\infty}^{\infty} \sum_{n_2 = -\infty}^{\infty} f[n_1, n_2] \cdot g[x - n_1, y - n_2]$$

elementwise multiplication and sum of a filter and the signal (image)

7x7 input (spatially) assume 3x3 filter

**=> 5x5 output** 

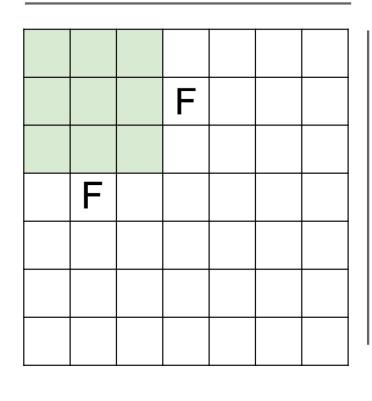

7x7 input (spatially)
assume 3x3 filter
applied with stride 2
=> 3x3 output!

7x7 input (spatially) assume 3x3 filter applied with stride 3?

doesn't fit! cannot apply 3x3 filter on 7x7 input with stride 3.

N

Output size:

(N - F) / stride + 1

e.g. 
$$N = 7$$
,  $F = 3$ :

stride 
$$1 \Rightarrow (7 - 3)/1 + 1 = 5$$

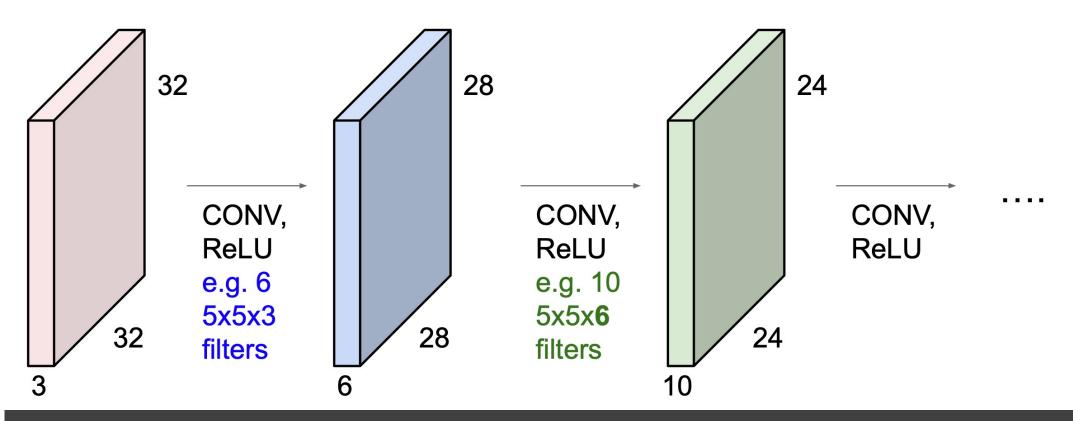

stride 
$$2 \Rightarrow (7 - 3)/2 + 1 = 3$$

stride 
$$3 \Rightarrow (7 - 3)/3 + 1 = 2.33 : \$$

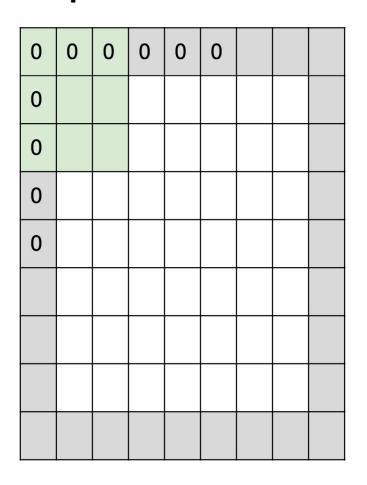

N

#### Remember back to...

E.g. 32x32 input convolved repeatedly with 5x5 filters shrinks volumes spatially! (32 -> 28 -> 24 ...). Shrinking too fast is not good, doesn't work well.

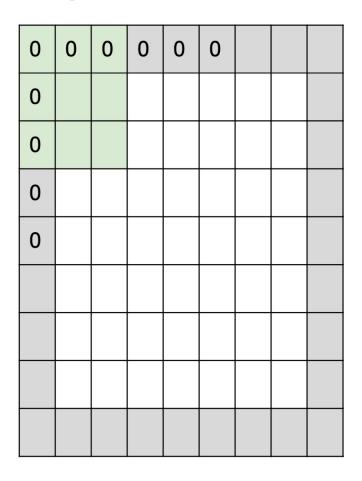

## In practice: Common to zero pad the border

e.g. input 7x7
3x3 filter, applied with stride 1
pad with 1 pixel border => what is the output?

7x7 output!

## In practice: Common to zero pad the border

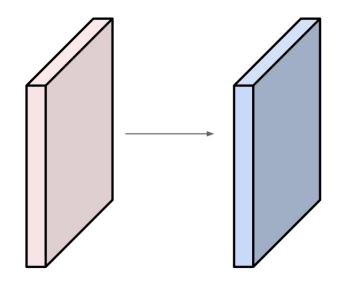

e.g. input 7x7
3x3 filter, applied with stride 1
pad with 1 pixel border => what is the output?

#### 7x7 output!

in general, common to see CONV layers with stride 1, filters of size FxF, and zero-padding with (F-1)/2. (will preserve size spatially)

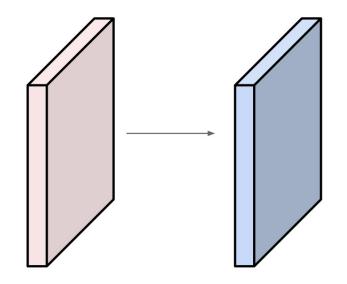

Input volume: **32x32x3**10 5x5 filters with stride 1, pad 2

Output volume size: ?

Input volume: 32x32x3

10 5x5 filters with stride 1, pad 2

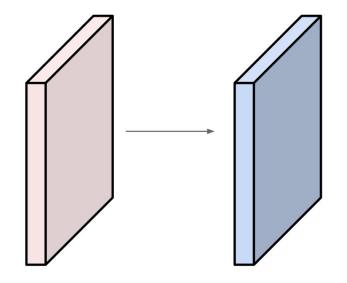

Output volume size:

$$(32+2*2-5)/1+1 = 32$$
 spatially, so

32x32x10

Input volume: **32x32x3** 10 5x5 filters with stride 1, pad 2

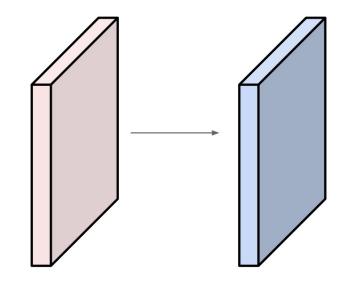

Number of parameters in this layer?

=> 76\*10 = **760** 

Input volume: 32x32x3

10 5x5 filters with stride 1, pad 2

Number of parameters in this layer? each filter has 5\*5\*3 + 1 = 76 params

INTELLIGENT NETWORKING & SYSTEM LAB. © 2021

(+1 for bias)

## Convolution layer: summary

#### Common settings:

Let's assume input is W<sub>1</sub> x H<sub>1</sub> x C

Conv layer needs 4 hyperparameters:

- Number of filters **K**
- The filter size **F**
- The stride S
- The zero padding P

This will produce an output of W<sub>2</sub> x H<sub>2</sub> x K where:

$$-W_2 = (W_1 - F + 2P)/S + 1$$

- 
$$H_2^- = (H_1 - F + 2P)/S + 1$$

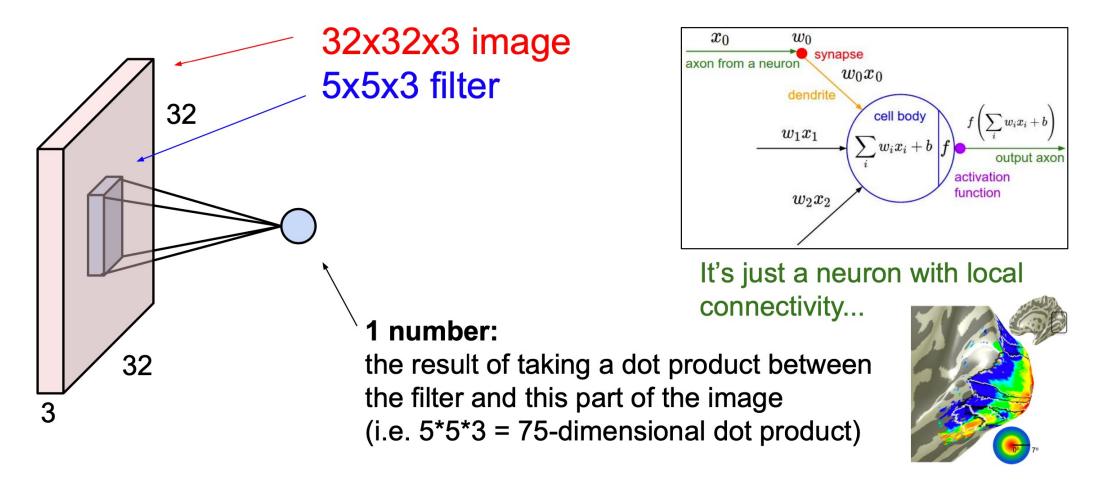

Number of parameters: F2CK and K biases

$$- F = 3, S = 1, P = 1$$

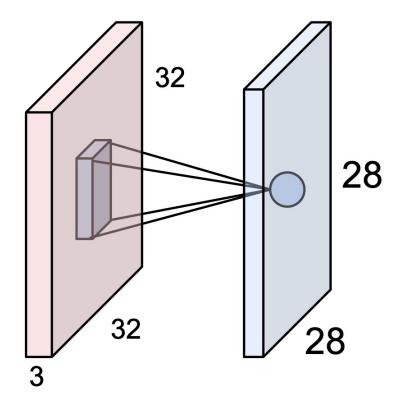

$$- F = 5, S = 1, P = 2$$

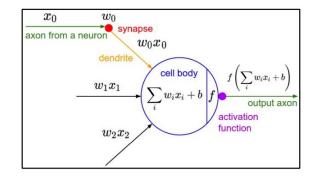

- 
$$F = 1, S = 1, P = 0$$

#### The brain/neuron view of CONV Layer

#### Receptive field

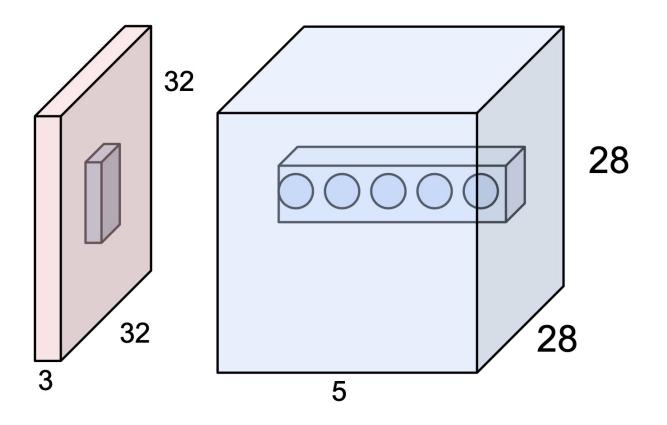

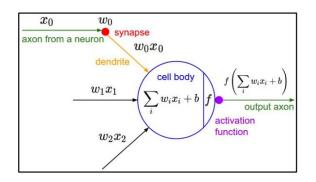

An activation map is a 28x28 sheet of neuron outputs:

- 1. Each is connected to a small region in the input
- 2. All of them share parameters

"5x5 filter" -> "5x5 receptive field for each neuron"

#### The brain/neuron view of CONV Layer

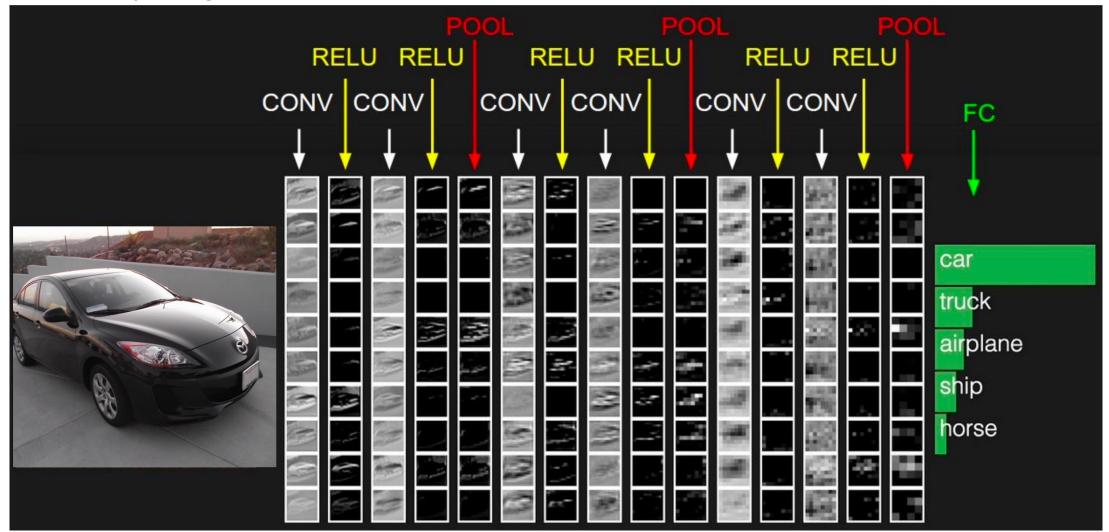

E.g. with 5 filters, CONV layer consists of neurons arranged in a 3D grid (28x28x5)

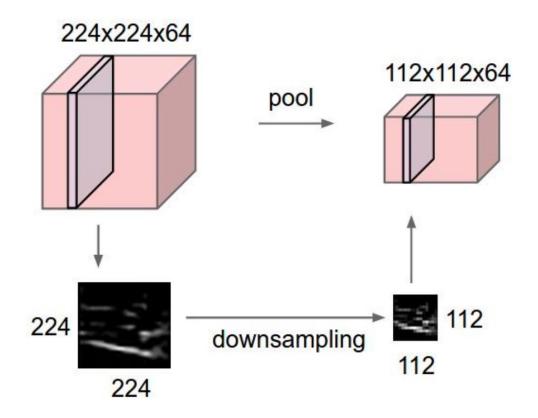

There will be 5 different neurons all looking at the same region in the input volume

#### two more layers to go: POOL/FC

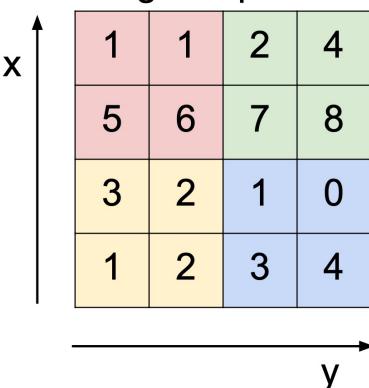

## Pooling layer

- makes the representations smaller and more manageable
- operates over each activation map independently:

#### **MAX POOLING**

#### Single depth slice

max pool with 2x2 filters and stride 2

6	8
3	4

## Pooling layer: summary

Let's assume input is W<sub>1</sub> x H<sub>1</sub> x C Conv layer needs 2 hyperparameters:

- The spatial extent F
- The stride S

This will produce an output of  $W_2 \times H_2 \times C$  where:

$$- W_2 = (W_1 - F)/S + 1$$

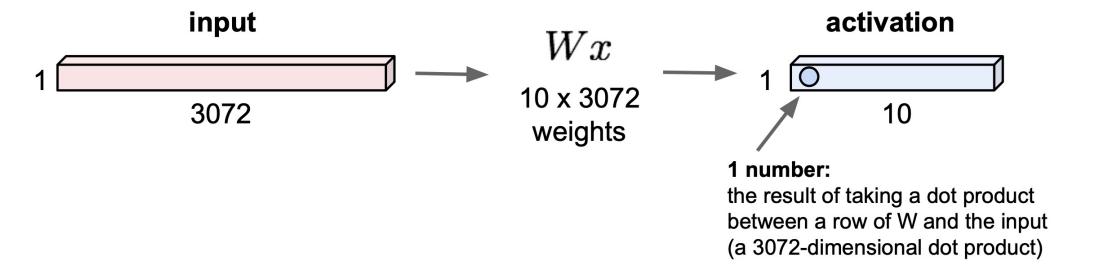

- 
$$H_2^- = (H_1 - F)/S + 1$$

Number of parameters: 0

# Fully Connected Layer

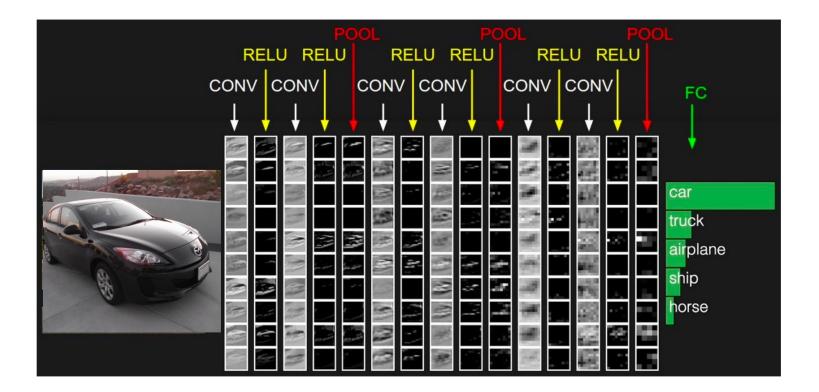

32x32x3 image -> stretch to 3072 x 1

Each neuron looks at the full input volume

## Fully Connected Layer (FC layer)

 Contains neurons that connect to the entire input volume, as in ordinary Neural Networks

# Summary

- ConvNets stack CONV,POOL,FC layers
- Trend towards smaller filters and deeper architectures
- Trend towards getting rid of POOL/FC layers (just CONV)
- Historically architectures looked like
   [(CONV-RELU)\*N-POOL?]\*M-(FC-RELU)\*K,SOFTMAX
   where N is usually up to ~5, M is large, 0 <= K <= 2.</li>
  - but recent advances such as ResNet/GoogLeNet have challenged this paradigm
